

HIGH VOLUME DEWATERING PUMPS

Submersible High Volume Dewatering Pumps

Tsurumi GSZ and GSD series of submersible heavy-duty pumps deliver high volume discharge. This former consists of the GSZ-4 (4-pole motor) that fully demonstrates the high head performance and the GSZ-6 (6-pole motor) that can discharge slurries laden with silt, earth, sand or other particulate. The GSD is a slurry pump, built with a high-chromium cast iron agitator. With extensive lineups featuring motor outputs of 22 to 75kW, these pumps are used in a wide range of fields from civil engineering and construction projects that demand high reliability to mining and large-scale works for building tunnels, bridges, dams, etc.

To stand up to rough working conditions, these pumps employ impellers made of high-chromium cast iron or cast 304 stainless steel, both of which deliver the high wear resistance needed in heavy-duty applications. The pumps are also designed for side discharge via a spiral path that ensures the passage of solids. And, their motors are wrapped in a water jacket that keeps the motor cool during extended operation at low water level. Reliable and durable by design and construction, Tsurumi's pumps are made for continuous duty.

Tsurumi also offers optional seawater-resistant versions, developed from years of research to draw and discharge seawater over extended periods of time.

GSZ-4: High head, high volume drainage pump with internal 4-pole motor

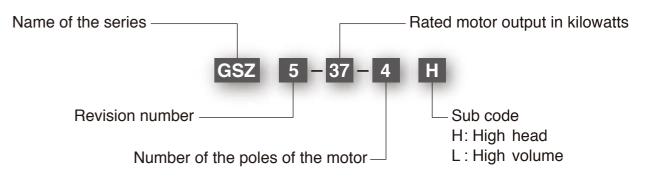

GSZ-6: High volume drainage pump with internal 6-pole motor capable of discharging slurries laden with silt, earth, sand or other particulate

GSD: High-powered slurry pump that delivers powerful agitation, high head and high volume discharge

Selection Table

Motor	Motor Output			37kW	45kW	55kW	75kW
	6"	150mm					
GSZ-4	8"	200mm					
	10"	250mm					
GSZ-6	8"	200mm					
GSD	8"	200mm					
400	10"	250mm					

Model Number Designation

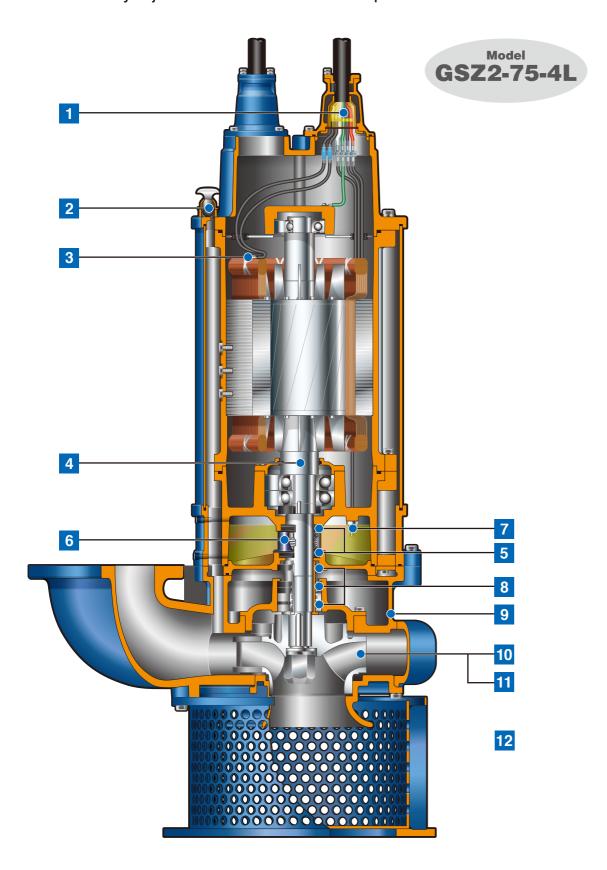

Options

Seawater-resistant version; Galvanic anode & Special impeller

✓ High temperature liquid version; Max. 60°C

Tsurumi hones its pump design in consideration of product characteristics. For example, because of the high head they deliver, the GSZ-4 and GSD have seal pressure relief ports that release pump pressure applied to the mechanical seal. Similarly, the GSZ-6 and GSD have impellers, suction plates and mouth rings made of high-chromium cast iron in order to defend against incoming wear-causing substances. And, if these parts wear down, the pumps maintain their original performance owing to a proprietary mechanism that continuously adjusts the clearance between the parts.

Spiral Design with Water Jacket

The side discharge, spiral design allows smoother passage of the sucked solid matters. The motor is cooled by a water jacket assuring efficient motor cooling even when the pump operates with its motor exposed to air.

1 Anti-wicking Cable Entry

Prevents water incursion due to capillary wicking should the power cable be damaged or the end submerged.

2 Air Release Valve

Fitted on the water jacket, it prevents the Air-lock. When air goes through the valve, the ball stays at the bottom, but when the pumped water starts to flow, it closes the outlet by its buoyancy.

3 Miniature Thermal Protectors

React to excessive heat caused by dry-running. The bimetal strip opens to cause the control panel to shut the power supply.

4 Shaft

Made of a solid material (without welds) of thoroughly proven bending strength and tensile strength.

5 Dual Inside Mechanical Seals with Silicon Carbide Faces

Isolated in the oil chamber where a clean, non-corrosive and abrasion-free lubricating environment is maintained. Compared with the water-cooled outside mechanical seal, it reduces the risk of failure caused by dry-heating and adhering matter. The silicon carbide provides 5 times higher corrosion, wear and heat resistance than the tungsten carbide. Rubber parts of the upper and lower fixing rings are made of NBR or fluororubber (Viton), which provides higher resistance to heat and chemicals.

6 Oil Lifter [Patented]

Provides lubrication and cooling of the seal faces down to 1/3 of normal oil level, thus maintaining a stable shaft sealing effect and prolonging seal life longer.

7 Leakage Sensor (55kW and above)

Detects flooding into the oil chamber that may occur in a worst case scenario. When flooding is detected, signals are sent to operate the indicator lamps through the external control panel.

8 Single/Triple/Quadruple Oil Seals + Labyrinth Ring (55kW and above)

Used as a "Dust Seal", a number of oil seals from 1 to 4 protect the mechanical seal from abrasive particles. The labyrinth ring is equipped to provide a better countermeasure against wear caused by high pressure generated in the casing and improve the maintainability for pumps of 55kW and above.

Protect the mechanical seal from pump pressure. They also protect the seal face by discharging wear particles.

${\bf 10} \ \textbf{High-chromium Cast Iron / Cast 304 Stainless Steel Impeller} \ (\texttt{GSZ-4})$

Resists wear caused by abrasive particles and enables the pump to maintain its original performance for an extended period of time.

[1] High-chromium Cast Iron Impeller & Suction Plate/Mouth Ring (GSZ-6 & GSD)

Made of high-chromium cast iron ensuring highest durability. Even if the performance drops due to wearing out of the impeller and/or suction plate/mouth ring, it can be improved by adjusting impeller clearance.

12 Agitating Mechanism (GSD)

Consists of a shaft-mounted agitator and a dedicated strainer. The agitator made of high-chromium cast iron resists wear caused by abrasive particles, and it suspends solids to assist in pumping sediments in combination with the strainer.

GSD

High head, high volume drainage pump with internal 4-pole motor

The GSZ-4-series is a submersible three-phase cast iron high head and high volume heavy-duty drainage pump driven by a 4-pole motor. The side discharge, spiral design allows smoother passage of the sucked solid matters. The motor is cooled by a water jacket that assures efficient motor cooling even when it operates with its motor exposed to air. The pump incorporates seal pressure relief ports that prevent the pumping pressure from applying to the shaft seal.

GSZ2-75-4

High volume drainage pump with internal 6-pole motor capable of discharging slurries laden with silt, earth, sand or other particulate

The GSZ-6-series is a submersible three-phase high power and high volume heavy-duty drainage pump driven by a 6-pole motor. In combination with abrasion-resistant wear parts, the very low speed motor ensures extremely long wear life. The side discharge, spiral design allows smoother passage of the sucked solid matters. The motor is cooled by a water jacket that assures efficient motor cooling even when it operates with its motor exposed to air.

GSZ5-22-6

High-powered slurry pump that delivers powerful agitation, high head and high volume discharge

The GSD-series is a submersible three-phase high power, high head and high volume heavy-duty slurry pump driven by a 4-pole motor. It is equipped with a high-chromium cast iron agitator that assists smooth suction of the settled matters. The side discharge, spiral design allows smoother passage of the sucked solid matters. The motor is cooled by a water jacket that assures efficient motor cooling even when it operates with its motor exposed to air. The pump incorporates seal pressure relief ports that prevent the pumping

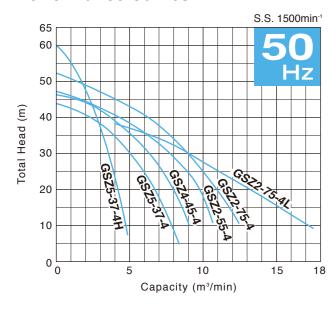

pressure from applying to the shaft seal.
